A5: Relational schema, validation and schema refinement

Our project, Answerly, is a web application for collaborative Questions and Answers.

This artifact contains the Relational Schema obtained by mapping from the Conceptual Data Model. The Relational Schema includes the relation schema, attributes, domains, primary keys, foreign keys and other integrity rules: UNIQUE, DEFAULT, NOT NULL, CHECK...

1. Relational Schema

Relation Reference	**Relation Compact Notation**
R01	user(**ID**, first_name *NN*, last_name *NN*, email *UK NN*, bio, username *UK NN*, password *NN*, *DF 0*)
R02	label(**ID**, name *NN*)
R03	notification(**ID**, content *NN*, date *DF Now*, viewed *DF False*, user_id → user *NN*)
R04	user_management(**ID**, status *NN*, user_id → user *UK NN*)
R05	vote(**ID**, vote, user_id → user *NN*, question_id → question, answer_id → answer *CK question_id = NN XOR answer_id = NN*)
R06	question(**ID**, user_id → user *NN*, title *NN*, description *NN*, nr_likes *NN DF 0*, nr_dislikes *NN DF 0*, question_date *NN DF Now CK nr_likes >= 0 AND nr_dislikes >= 0*)
R07	answer(**ID**, user_id → user *NN*, question_id → question *NN*, answer_date *NN DF Now*, content *NN*, nr_likes *NN DF 0*, nr_dislikes *NN DF 0*, marked_answer *NN DF FALSE CK nr_likes >= 0 AND nr_dislikes >= 0*)
R08	comment(**ID**, user_id → user *NN*, questionID→Question, answerID→Answer *CK question_id = NN XOR answer_id = NN*, content *NN*, comment_date *NN DF Now*)
R09	report(**ID**, userID→User, questionID→Question, answerID→Answer, commentID→Comment *CK user_id = NN XOR question_id = NN XOR answer_id = NN XOR comment_id = NN*)
R10	report_status(**ID**, report_id → report, state *NN DF unresolved CK state IN States*, comment, responsible_user → user_management *NN*)
R11	following(**userID** → user, **labelID** → label))
R12	about(**questionID** → question, **labelID** → label)

- UK means UNIQUE KEY
- NN means NOT NULL
- DF means DEFAULT
- CK means CHECK

2. Domains

Specification of additional domains:

Domain Name	Domain Specification
Now	DATE DEFAULT CURRENT_TIMESTAMP_
Report States	ENUM ('unresolved', 'reviewing', 'resolved')
User Status	ENUM ('normal', 'moderator', 'administrator', 'banned')

3. Functional Dependencies and schema validation

In the following tables, all relations are in the Boyce-Codd Normal Form, since for each non trivial functional dependency A → B, A is a (super)key of the relation.
